

NETWORK SECURITY ASSESSMENT

Data security can no longer be taken for granted. Ask yourself these questions:

- What would happen if all of my private data became public information?
- How vulnerable is my network to outside attack?
- What have I done to protect my information from an inside attack?
- Are my users trained against social engineering attempts?

If you haven't already dealt with these issues, you can't afford to wait any longer.

How does it work?

Step 1. Our engineers will run a full vulnerability scan on your network from outside of your network. We will identify every network opening and analyze them for potential security vulnerabilities.

Step 2. An engineer will come to your site and assess your internal network configuration, server software, and physical security.

Step 3. Policy review. We will review your internal security policies and disaster recovery documentation and make recommendations for revision if necessary.

Step 4. Once the vulnerabilities have been identified, the detailed information on each vulnerability, as well as a list of recommendations, are included in a report for use by your IT department and management.

A Network Security Assessment is only one piece of the network security puzzle. We can also provide:

- Written Security Policy
- Firewalls/VPNs
- Intrusion Prevention Systems
- Event Log monitoring, reporting and archiving
- Change Management
- Web Filtering
- Email Scanning
- Spam Control
- Anti-Virus/Spyware/Phishing protection
- Secure Backups
- Workstation Access Privileges
- Encryption

WHO WE ARE

SOTA Technologies is a full service IT Solutions Company. We are dedicated to providing the right technological solutions to fit your business needs.
